Capstone Project

STEP 1:

- Choice of client: SportsStats. The dataset is divided into two basic CSV files that are easy to work with.
- Importing Data: Data analysis is being done through the use of Jupyter Notebooks. CSV files were uploaded to the notebooks for easy work, followed by pandas reading, initially as csv in python language for better analysis. Nulls were kept not to infere with the data.

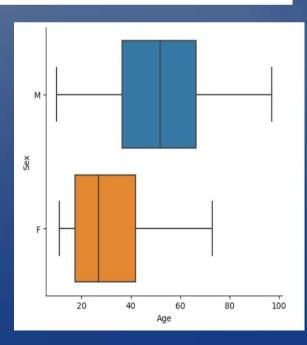

STEP 1: Screenshots of EDA:

ERD PROPOSAL:

STEP 2:

Description:

This initial step of the analysis consisted in understanding better the consistency of the data. A lot more EDA was done looking for both numeric and categorical values and patterns in them. It was possible to see the variation in age, weight and height, with max, min, mean or median values. A far superior count of male athletes is shown compared to female athletes, accompanied by a surprisingly different profile by gender. The data can provide interesting information regarding the profile of athletes, including by sport as well as the number of medals earned by athletes or countries in each game. Anyone interesting in this information can look into this data.

STEP 2:

Questions:

Which games are being represented?

What is the time range of the data?

What are the sports best represented?

How does gender affect other values?

How does representation by a country increase the probability of winning?

Hypotheses and Approach:

So far the approach is to investigate correlation between the variables and see how one can affect the other. Due to the large size of the data, aggregations have been done for the purpose of better understanding the distribution, followed by several different attempts of plotting looking for insights. Investigation should proceed taking into account that athletic women have shown to be shorter and thinner than average, while men are much taller with a greater body mass than average. Pointers should also move forward as the relationship between their profiles and the sport they play become more evident. It should also be interesting to find out how representation increases the chance of winning, that is, more athletes by a country means the country wins more.
